

The mobile Companion App

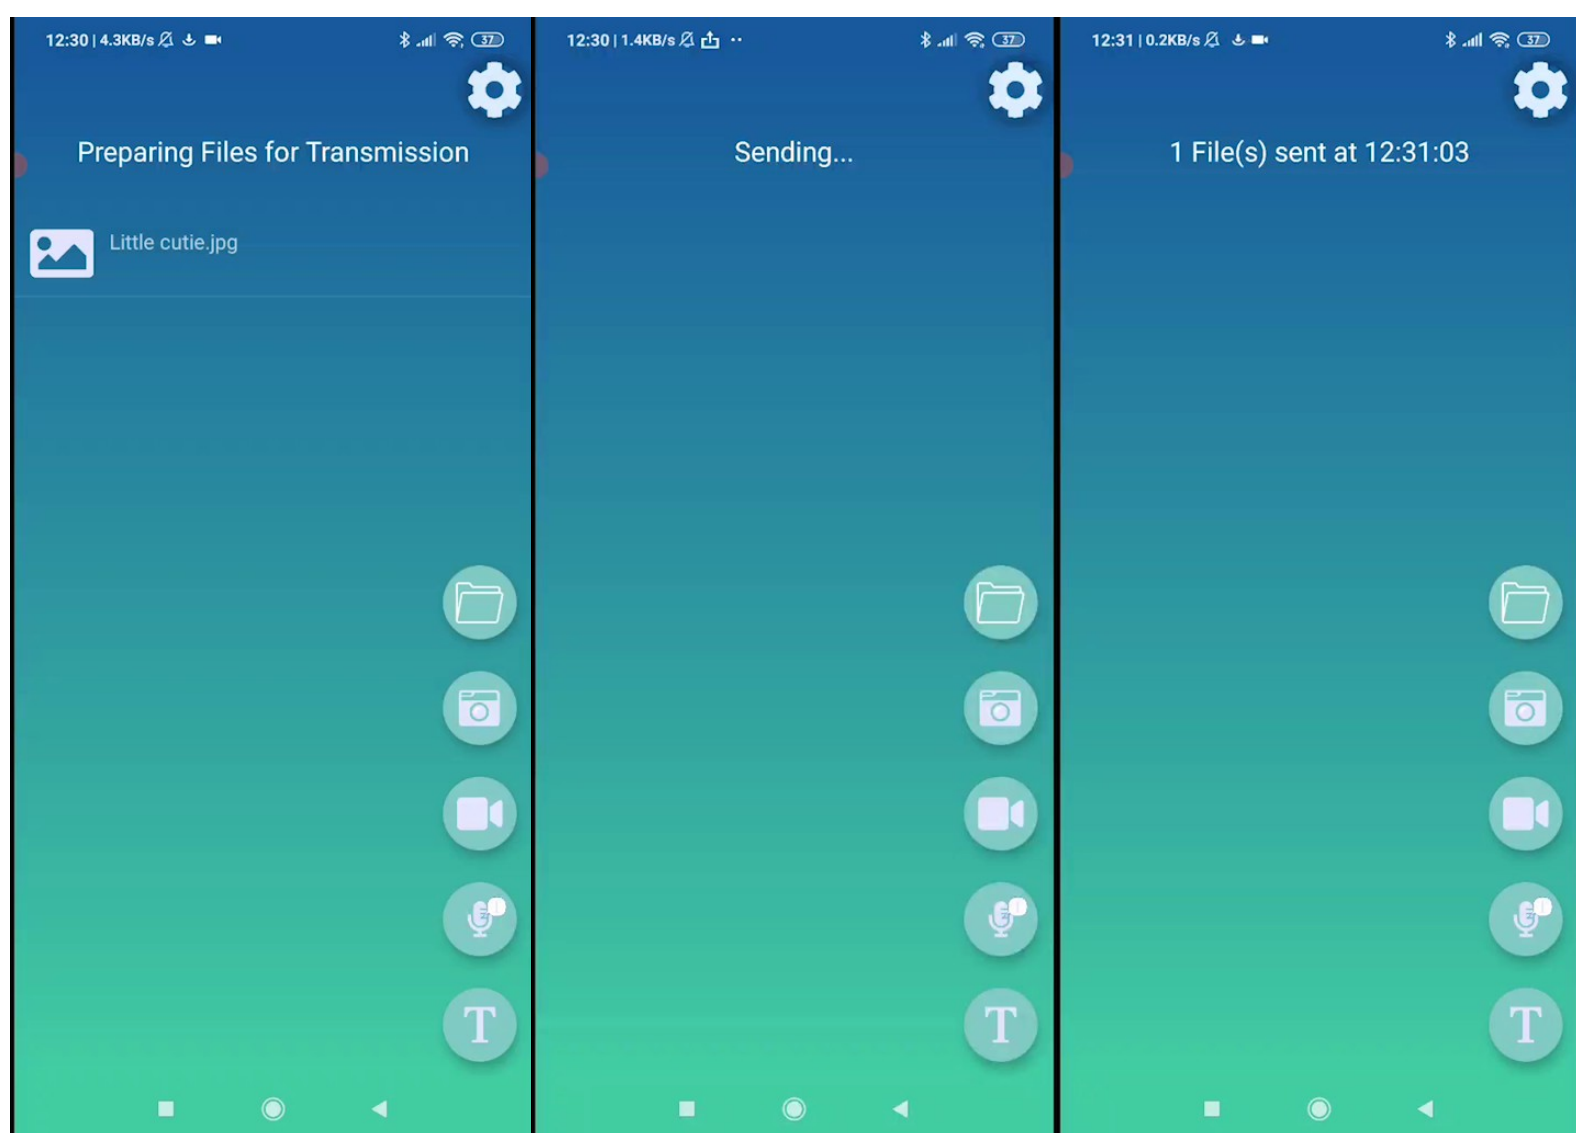

When you first start the app, it will ask for permissions for files and microphone usage. The app will never use this on its own, only when you make a voice recording or select files to send. The one-time password is used to secure the connection between the headset and your phone. I will show you how this works during setup.

The buttons on the side are for (from the very top right to the bottom):

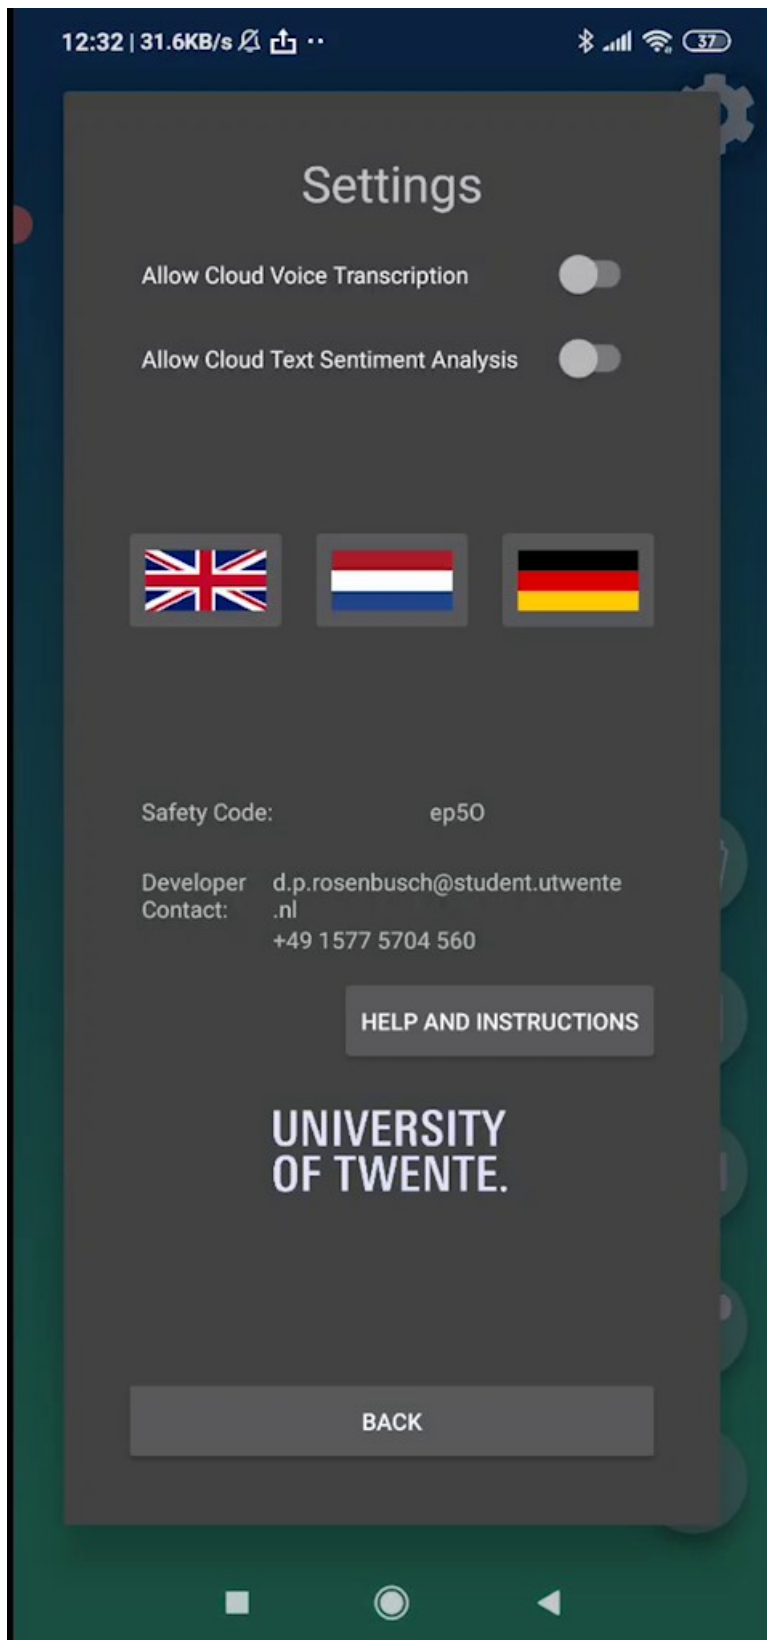

- Settings
- Select files
- Take photo
- Record video
- Create voice recording
- Create text note

Here you can add additional information to your recording, but you can also skip this step.

The app will constantly try to send the files to the headset until a connection can be established. Therefore, it does not matter if you create or select files without the headset being reachable (i.e. on the same WiFi network).

The following settings can be made:

- Allow Cloud Voice Transcription

If you check this option, your voice recording will be converted to continuous text using online services.

- Allow Cloud Text Sentiment Analysis

If you check this option, your texts will be classified according to their mood using online services.

If you don't want your voice recordings and texts to be temporarily stored on the web for analysis, leave these options unchecked.

- Language selection

These settings affect the language within the diary.

In addition you can again view the One-time password and contact details. You are welcome to call or write to me.

Last but not least there is a help button, which leads to all tutorials in video and text form.
